

General overview

The **FABA™ A12** is a fall arrester system and part of Personal Protective Equipment (PPE) European Directive (EU 2016/425). The system is certified according to the standard EN 353-1:2018 and EN ISO 14122-4:2016. The FABA A12 system is certified for a user weight (including user weight and their equipment) up to 150kg.

FABA enables safe use of fixed vertical ladders or manhole rungs, e.g.

- on towers, stacks, high storage tanks, bridge piers, masts, machines and operating facilities
- on high-rise racks and industrial plants, buildings and facades
- in pits, mines as well as water and wastewater basins

Technical specification

Standard EN ISO 14122-4:2016 specifies that rest platforms shall be installed at intervals <12 m for ladders equipped with fall arrest devices, taking into account that local law can even impose more restrictive distances. In consequence, TRACTEL has developed a foldable rest platform for its FABA ladders and rails.

Rest platforms are designed to allow the user to have a pause during its climbing or having a stable intermediate level from where some tasks might be done. In such a case, an additional work positioning lanyard is required to secure the user.

The rest platform is to be bolted directly on the central rail, without affecting the structure where the ladder is mounted on. This makes the rest platform suitable for being installed on any existing FABA ladder or rail.

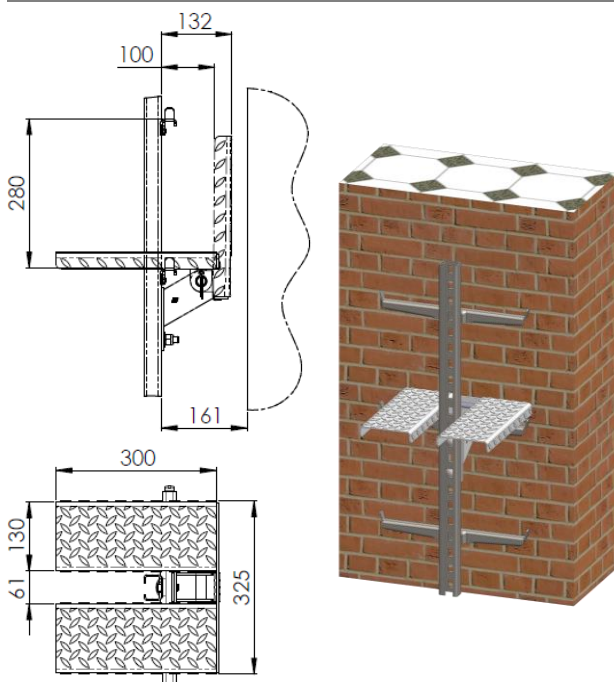

Features:

- It has two steps 300 x 130 mm, made of diamond plate. This increases the grip of working shoes, even in wet conditions, and gives the user stability and confidence.
- Steps are foldable to ease the climbing.
- Steps are folded simultaneously (so they can be folded with just one hand).
- Design makes that steps lay in a stable position when folded.
- 2 kits of bolting (code 508107) included.

Codes:

Description	Code	Material
Rest platform - ladder	242095	Galvanised steel
	242135	Stainless steel (1.4571)
Rest platform - rail	242255	Galvanised steel
	242275	Stainless steel (1.4571)
